HARDWARE DESIGN FOR MACHINE LEARNING

Pooja Jawandhiya

School of Electrical and Electronic Engineering, Nanyang Technological University, Singapore

ABSTRACT

Things like growing volumes and varieties of available data, cheaper and more powerful computational processing, data storage and large-value predictions that can guide better decisions and smart actions in real time without human intervention are playing critical role in this age. All of these require models that can automatically analyse large complex data and deliver quick accurate results – even on a very large scale. Machine learning plays a significant role in developing these models. The applications of machine learning range from speech and object recognition to analysis and prediction of finance markets. Artificial Neural Network is one of the important algorithms of machine learning that is inspired by the structure and functional aspects of the biological neural networks. In this paper, we discuss the purpose, representation and classification methods for developing hardware for machine learning with the main focus on neural networks. This paper also presents the requirements, design issues and optimization techniques for building hardware architecture of neural networks.

KEYWORDS

Artificial intelligence (AI), application specific integrated circuit (ASIC), artificial neural network (ANN), central processing unit (CPU), field programmable gate array (FPGA), graphics processing unit (GPU), machine learning (ML), neurochip

ABSTRACT

Forged documents specifically passport, driving licence and VISA stickers are used for fraud purposes including robbery, theft and many more. So detecting forged characters from documents is a significantly important and challenging task in digital forensic imaging. Forged characters detection has two big challenges. First challenge is, data for forged characters detection is extremely difficult to get due to several reasons including limited access of data, unlabeled data or work is done on private data. Second challenge is, deep learning (DL) algorithms require labeled data, which poses a further challenge as getting labeled is tedious, time-consuming, expensive and requires domain expertise. To end these issues, in this paper we propose a novel algorithm, which generates the three datasets namely forged characters detection for passport (FCD-P), forged characters detection for driving licence (FCD-D) and forged characters detection for VISA stickers (FCD-V). To the best of our knowledge, we are the first to release these datasets. The proposed algorithm starts by reading plain document images, simulates forging simulation tasks on five different countries' passports, driving licences and VISA stickers. Then it keeps the bounding boxes as a track of the forged characters as a labeling process. Furthermore, considering the real world scenario, we performed the selected data augmentation accordingly. Regarding the stats of datasets, each dataset consists of 15000 images having size of 950 x 550 of each. For further research purpose we release our algorithm code 1 and, datasets i.e. FCD-P 2, FCD-D 3 and FCD-V 4.

AUTHORS

Teerath kumar received his Bachelor's degree in Computer Science with distinction from National University of Computer and Emerging Science (NUCES), Islamabad, Pakistan, in 2018. Currently, he is pursuing PhD from Dublin City University, Ireland. His research interests include advanced data augmentation, deep learning for medical imaging, generative adversarial networks and semi-supervised learning.

Muhammad Turab is an undergraduate final year student at Computer Systems Engineering MUET, Jamshoro. He has done 60+ projects with java and python, all projects can be found on GitHub. His research interests include deep learning, computer vision and data augmentation for medical imaging.

Shahnawaz Talpur is the chairman of Computer Systems Engineering Department at Muet Jamshoro. He has done his masters from MUET and PhD from Beijing Institute of Technology, China. His research interests include high performance computing, computer architecture and big data.

R. Brennan is an Assistant Professor in the School of Computing, Dublin City University, founding Chair of the DCU MA in Data Protection and Privacy Law and a Funded investigator in the Science Foundation Ireland ADAPT Centre for Digital Content Technology which is funded under the SFI Research Centres Programme (Grant 13/RC/2106) and is co-funded under the European Regional Development Fund, His main research interests are data protection, data value, data quality, data privacy, data/AI governance and semantics.

M. Bendeache is an Assistant Professor in the School of Computing at Dublin City University, Ireland. She obtained her Ph.D. degree from University College Dublin, Ireland in 2018. Malika's research interests span the areas of Big data Analytics, Machine Learning, Data Governance, Cloud Computing, Blockchain, Security, and Privacy. She is an academic member and a Funded Investigator of ADAPT and Lero research centres.

PREDICTING STUDENT ACADEMIC PERFORMANCE IN BLENDED LEARNING USING ARTIFICIAL NEURAL NETWORKS

Nick Z. Zacharis

Department of Computer Systems Engineering, Technological Educational Institute of Piraeus, Athens, Greece

ABSTRACT

Along with the spreading of online education, the importance of active support of students involved in online learning processes has grown. The application of artificial intelligence in education allows instructors to analyze data extracted from university servers, identify patterns of student behavior and develop interventions for struggling students. This study used student data stored in a Moodle server and predicted student success in course, based on four learning activities - communication via emails, collaborative content creation with wiki, content interaction measured by files viewed and self-evaluation through online quizzes. Next, a model based on the Multi-Layer Perceptron Neural Network was trained to predict student performance on a blended learning course environment. The model predicted the performance of students with correct classification rate, CCR, of 98.3%.

ABSTRACT

The proportional-integral-derivative (PID) controllers are the most popular controllers used in industry because of their remarkable effectiveness, simplicity of implementation and broad applicability. However, manual tuning of these controllers is time consuming, tedious and generally lead to poor performance. This tuning which is application specific also deteriorates with time as a result of plant parameter changes. This paper presents an artificial intelligence (AI) method of particle swarm optimization (PSO) algorithm for tuning the optimal proportional-integral derivative (PID) controller parameters for industrial processes. This approach has superior features, including easy implementation, stable convergence characteristic and good computational efficiency over the conventional methods. Ziegler- Nichols, tuning method was applied in the PID tuning and results were compared with the PSO-Based PID for optimum control. Simulation results are presented to show that the PSO-Based optimized PID controller is capable of providing an improved closed-loop performance over the Ziegler- Nichols tuned PID controller Parameters. Compared to the heuristic PID tuning method of Ziegler-Nichols, the proposed method was more efficient in improving the step response characteristics such as, reducing the steady-states error; rise time, settling time and maximum overshoot in speed control of DC motor.

SOFTWARE TESTING: ISSUES AND CHALLENGES OF ARTIFICIAL INTELLIGENCE & MACHINE LEARNING

Kishore Sugali, Chris Sprunger and Venkata N Inukollu

Department of Computer Science and, Purdue University, Fort Wayne, USA

ABSTRACT

The history of Artificial Intelligence and Machine Learning dates back to 1950's. In recent years, there has been an increase in popularity for applications that implement AI and ML technology. As with traditional development, software testing is a critical component of an efficient AI/ML application. However, the approach to development methodology used in AI/ML varies significantly from traditional development. Owing to these variations, numerous software testing challenges occur. This paper aims to recognize and to explain some of the biggest challenges that software testers face in dealing with AI/ML applications. For future research, this study has key implications. Each of the challenges outlined in this paper is ideal for further investigation and has great potential to shed light on the way to more productive software testing strategies and methodologies that can be applied to AI/ML applications

A REVIEW ON OPTIMIZATION OF LEAST SQUARES SUPPORT VECTOR MACHINE FOR TIME SERIES FORECASTING

Yuhanis Yusof¹ and Zuriani Mustaffa²

¹ School of Computing, Universiti Utara Malaysia, Malaysia

² Faculty of Computer Systems & Software Engineering, Universiti Malaysia Pahang, Malaysia

ABSTRACT

Support Vector Machine has appeared as an active study in machine learning community and extensively used in various fields including in prediction, pattern recognition and many more. However, the Least Squares Support Vector Machine which is a variant of Support Vector Machine offers better solution strategy. In order to utilize the LSSVM capability in data mining task such as prediction, there is a need to optimize its hyper parameters. This paper presents a review on techniques used to optimize the parameters based on two main classes; Evolutionary Computation and Cross Validation.

ABSTRACT

Nature has evolved highly advanced systems capable of performing complex computations, adoption and learning using analog computations. Furthermore nature has evolved techniques to deal with imprecise analog computations by using redundancy and massive connectivity. In this paper we are making use of Artificial Neural Network to demonstrate the way in which the biological system processes in analog domain.

We are using 180nm CMOS VLSI technology for implementing circuits which performs arithmetic operations and for implementing Neural Network. The arithmetic circuits presented here are based on MOS transistors operating in subthreshold region. The basic blocks of artificial neuron are multiplier, adder and neuron activation function.

The functionality of designed neural network is verified for analog operations like signal amplification and frequency multiplication. The network designed can be adopted for digital operations like AND, OR and NOT. The network realizes its functionality for the trained targets which is verified using simulation results. The schematic, Layout design and verification of proposed Neural Network is carried out using Cadence Virtuoso tool.

Abstract

In recent years, consumers and legislation have been pushing companies to optimize their activities in such a way as to reduce negative environmental and social impacts more and more. In the other side, companies must keep their total supply chain costs as low as possible to remain competitive. This work aims to develop a model to traveling salesman problem including environmental impacts and to identify, as far as possible, the contribution of genetic operator's tuning and setting in the success and efficiency of genetic algorithms for solving this problem with consideration of CO₂ emission due to transport. This efficiency is calculated in terms of CPU time consumption and convergence of the solution. The best transportation policy is determined by finding a balance between financial and environmental criteria. Empirically, we have demonstrated that the performance of the genetic algorithm undergo relevant improvements during some combinations of parameters and operators which we present in our results part.

Authors

1EL HASSANI Hicham received his engineer degree of Industrial Engineering in the National School of applied sciences in 2009. In 2011 He joined the Laboratory of Computer Systems and Renewable Energy (LISER) of the ENSEM Hassan II University Casablanca Morocco. His current research field is Modeling Simulation and Optimization of global supply chain including environmental concerns and reverse logistic.

2Said Benkachcha received his DESA in Laboratory of Mechanics of Structures and Materials, LMSM, of ENSEM – Casablanca in 2006. In 2011 He joined the Laboratory of Computer Systems and Renewable Energy (LISER) of the ENSEM Hassan II University, Casablanca, Morocco. His current research field is demand forecasting and collaborative warehouse management.

3Jamal BENHRA received his PhD in Automatic and Production Engineering from National Higher School of Electricity and Mechanics (ENSEM), Casablanca in 2007. He has his Habilitation to drive Researchs in Industrial Engineering from Science and Technology University, SETTAT in 2011. He is Professor and responsible of Industrial Engineering Department in National Higher School of Electricity and Mechanics (ENSEM), Hassan II University, Casablanca, Morocco. His current main research interests concern Modeling, Robot, Optimization, Meta-heuristic, and Supply Chain Management.

USING SENTIMENT ANALYSIS FOR STOCK EXCHANGE PREDICTION

ABSTRACT

The economic growth is a consensus in any country. To grow economically, it is necessary to channel the revenues for investment. One way of raising is the capital market and the stock exchanges. In this context, predicting the behavior of shares in the stock exchange is not a simple task, as it involves variables not always known and can undergo various influences, from the collective emotion to high-profile news. Such volatility can represent considerable financial losses for investors. In order to anticipate such changes in the market, it has been proposed various mechanisms trying to predict the behavior of an asset in the stock market, based on previously existing information. Such mechanisms include statistical data only, without considering the collective feeling. This paper is going to use natural language processing algorithms (LPN) to determine the collective mood on assets and later with the help of the SVM algorithm to extract patterns in an attempt to predict the active behaviour.

Reviewing Process Mining Applications and Techniques in Education

Athanasios Sypsas and Dimitris Kalles

School of Science and Technology, Hellenic Open University, Patras, Greece

ABSTRACT

Process Mining (PM) emerged from business process management but has recently been applied to educational data and has been found to facilitate the understanding of the educational process. Educational Process Mining (EPM) bridges the gap between process analysis and data analysis, based on the techniques of model discovery, conformance checking and extension of existing process models. We present a systematic review of the recent and current status of research in the EPM domain, focusing on application domains, techniques, tools and models, to highlight the use of EPM in comprehending and improving educational processes.

KEYWORDS

Process Mining, Educational Process Mining, educational applications, process model.

AUTHORS

Athanasios Sypas is a PhD candidate at Hellenic Open University, School of Science and Technology, Greece. His main scientific interests are Simulation, Artificial Intelligence, Distance Learning and Programming.

Dimitris Kalles is a Professor on “Artificial Intelligence – Applications” with the Hellenic Open University (HOU) and Director of the undergraduate study programme “Computer Science”. His main research interests are in Artificial Intelligence and Machine Learning and his work also has a strong focus in Educational Technology and Software Engineering. He has published over 100 papers in scientific journals and conference proceedings and his work has received more than 1000 citations.
